

2011 JUL -5 AM 9:21

MISSISSIPPI STATE DEPARTMENT OF HEALTH

BUREAU OF PUBLIC WATER SUPPLY

CALENDAR YEAR 2010 CONSUMER CONFIDENCE REPORT CERTIFICATION FORM

Coles Community Water Association, Inc.
Public Water Supply Name

0030001
List PWS ID #s for all Water Systems Covered by this CCR

The Federal Safe Drinking Water Act requires each community public water system to develop and distribute a consumer confidence report (CCR) to its customers each year. Depending on the population served by the public water system, this CCR must be mailed to the customers, published in a newspaper of local circulation, or provided to the customers upon request.

Please Answer the Following Questions Regarding the Consumer Confidence Report

- Customers were informed of availability of CCR by: (Attach copy of publication, water bill or other)
Advertisement in local paper
On water bills
Other

Date customers were informed: 7/1/2011

- CCR was distributed by mail or other direct delivery. Specify other direct delivery methods:

Date Mailed/Distributed: 1/1

- CCR was published in local newspaper. (Attach copy of published CCR or proof of publication)

Name of Newspaper: Wilk-Amite Record

Date Published: 7/1/2011

- CCR was posted in public places. (Attach list of locations)

Date Posted: 1/1

- CCR was posted on a publicly accessible internet site at the address: www.

CERTIFICATION

I hereby certify that a consumer confidence report (CCR) has been distributed to the customers of this public water system in the form and manner identified above. I further certify that the information included in this CCR is true and correct and is consistent with the water quality monitoring data provided to the public water system officials by the Mississippi State Department of Health, Bureau of Public Water Supply.

Signature of Geneva Wick, Secretary
Name/Title (President, Mayor, Owner, etc.)

7-1-2011
Date

Mail Completed Form to: Bureau of Public Water Supply/P.O. Box 1700/Jackson, MS 39215
Phone: 601-576-7518

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Miocene Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. The general susceptibility rankings assigned to each well of this system are provided immediately below. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Coles Community Water Association have received a moderate susceptibility ranking to contamination.

If you have any questions about this report or concerning your water utility, please contact Geneva at 601-639-7218. We want our valued customers to be informed about their water utility. If you want to learn more, please attend the annual meeting scheduled for Monday, May 9, 2011 at 6:30 PM at the Firehouse.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2010. In cases where monitoring wasn't required in 2010, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

TEST RESULTS								
Contaminant	Violation Y/N	Date Collected	Level Detected	Range of Detects or # of Samples Exceeding MCL/ACL	Unit Measurement	MCLG	MCL	Likely Source of Contamination
Inorganic Contaminants								
10. Barium	N	2008*	.076	No Range	ppm	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits

16. Fluoride	N	2008*	.106	No Range	ppm	4	4	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
17. Lead	N	2008*	2	0	ppb	0	AL=15	Corrosion of household plumbing systems, erosion of natural deposits
Disinfection By-Products								
Chlorine	N	2010	.91	.91 – 1.27	ppm	0	MRDL = 4	Water additive used to control microbes

* Most recent sample. No sample required for 2010.

As you can see by the tables, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected, however, the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our Water Association is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

The Coles Community Water Association work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

2010 Annual Drinking Water Quality Report
Olemiss Community Water Association
FWDA 000001
July 2011

Water is precious to provide to you this year's Annual Quality Water Report. Our report is designed to inform you about the quality of the water you are drinking and to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect the water resources. We are committed to ensuring the quality of your water. Our water source is groundwater drawn from the Gloster Aquifer.

The water quality assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify individual sources of contamination. The general susceptibility findings are shown in each section of the report and are provided in the table below. A report containing detailed information on how the susceptibility determinations were made has been forwarded to our public water system and is available for viewing upon request. The staff for the Olemiss Community Water Association have reviewed the susceptibility findings to date.

If you have any questions about this report or anything you have read, please contact Olemiss at 601-639-7778. We want our water customers to be informed about their water quality. If you want to learn more, please attend the special meeting scheduled by Olemiss, May 8, 2011 at 6:30 PM at the location below.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were included during the period of January 1st to December 31st, 2010. In cases where monitoring equipment is used, the table reflects the monitoring results. As water travels over the surface of soil or underground, it picks up substances or contaminants from the ground surface or from beneath the ground. Contaminants, such as metals and pesticides, that may come from sewage treatment plants, industrial processes, agricultural practices, and other sources, may be transported to groundwater. Some contaminants, such as radon, which may be naturally occurring or result from other natural sources, may be transported to groundwater. Some contaminants, such as radon, which may be naturally occurring or result from other natural sources, may be transported to groundwater. Some contaminants, such as radon, which may be naturally occurring or result from other natural sources, may be transported to groundwater.

In this table you will find many terms and abbreviations you may not be familiar with. To help you better understand these terms we provide the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - the "Maximum Allowable" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLG as is feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal MCLG" is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are for a range of water.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that an MRDL of a disinfectant is necessary for community water systems.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

One part per billion (ppb) or Micrograms per liter (µg/L) - one part per billion corresponds to one minute in ten years of a single penny in \$100,000.

One part per million (ppm) or Milligrams per liter (mg/L) - one part per million corresponds to one minute in 2,000 years, or a single penny in \$100,000.

TEST RESULTS

Contaminant	Violation	Concentration	Unit	Level	MRDL	MCLG	MCL	Other Source of Contamination
Inorganic Contaminants								
As	N	0.000	mg/L	No Range	ppm	0	0	0
B	N	0.000	mg/L	No Range	ppm	0	0	0
Ca	N	100	mg/L	0	0	0	0	0
Cl	N	100	mg/L	0	0	0	0	0
Cr	N	0.000	mg/L	0	0	0	0	0
Cu	N	0.000	mg/L	0	0	0	0	0
Fe	N	0.30	mg/L	0	0	0	0	0
Mn	N	0.05	mg/L	0	0	0	0	0
N	N	0.000	mg/L	0	0	0	0	0
NO ₂ -N	N	0.000	mg/L	0	0	0	0	0
NO ₃ -N	N	0.000	mg/L	0	0	0	0	0
P	N	0.000	mg/L	0	0	0	0	0
S	N	0.000	mg/L	0	0	0	0	0
Se	N	0.000	mg/L	0	0	0	0	0
Si	N	0.000	mg/L	0	0	0	0	0
T	N	0.000	mg/L	0	0	0	0	0
U	N	0.000	mg/L	0	0	0	0	0

W	N	0.000	mg/L	0	0	0	0	0
Zn	N	0.000	mg/L	0	0	0	0	0
Disinfection By-Products								
Chloroform	N	0.000	mg/L	0	0	0	0	0
Dibromochloromethane	N	0.000	mg/L	0	0	0	0	0
Trihalomethanes	N	0.000	mg/L	0	0	0	0	0

If you can see by the table, our system had no violations. This shows that your drinking water meets or exceeds all Federal and State requirements. We have looked through our monitoring and testing that some contaminants have been detected, however, the EPA has determined that our water is safe to drink.

We will continue to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are not available at this time. If you are concerned about the quality of your water, you may wish to have your water tested before using water for drinking or cooking. If you are concerned about the quality of your water, you may wish to have your water tested before using water for drinking or cooking.

It is important to know that your drinking water, testing methods, and steps you can take to minimize exposure is available from the State Drinking Water Hotline at 1-800-452-6739. For more information, please contact the State Drinking Water Hotline at 1-800-452-6739.

Some sources of drinking water are subject to natural contamination by substances that are naturally occurring or man-made. These substances include radon, arsenic, and other chemicals and radioactive substances. All drinking water, including bottled water, may occasionally be expected to contain at least small amounts of such contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be found by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-452-6739.

Some people may be more vulnerable to contaminants in drinking water than the general population. Infants, children, pregnant women, and the elderly are more vulnerable to contaminants in drinking water than the general population. People with compromised immune systems, such as those with cancer, kidney disease, and other chronic conditions, are also more vulnerable to contaminants in drinking water. These people should consult with their health care providers about appropriate means to lessen the risk of exposure to contaminants in drinking water. For more information, please contact the State Drinking Water Hotline at 1-800-452-6739.

The Olemiss Community Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water resources, which are the basis of the community, the way of life and our children's future.
