

**MISSISSIPPI STATE DEPARTMENT OF HEALTH
BUREAU OF PUBLIC WATER SUPPLY
CCR CERTIFICATION
CALENDAR YEAR 2015
CITY OF PEARL**

2016 JUN 13 AM 9:40

Public Water Supply Name

0610017

List PWS ID #s for all Community Water Systems included in this CCR

The Federal Safe Drinking Water Act (SDWA) requires each Community public water system to develop and distribute a Consumer Confidence Report (CCR) to its customers each year. Depending on the population served by the public water system, this CCR must be mailed or delivered to the customers, published in a newspaper of local circulation, or provided to the customers upon request. Make sure you follow the proper procedures when distributing the CCR. **You must mail, fax or email a copy of the CCR and Certification to MSDH. Please check all boxes that apply.**

Customers were informed of availability of CCR by: *(Attach copy of publication, water bill or other)*

- Advertisement in local paper (attach copy of advertisement)
 On water bills (attach copy of bill)
 Email message (MUST Email the message to the address below)
 Other _____

Date(s) customers were informed: ____ / ____ / ____ , ____ / ____ / ____

CCR was distributed by U.S. Postal Service or other direct delivery. Must specify other direct delivery methods used _____

Date Mailed/Distributed: **6 / 2 / 2016**

CCR was distributed by Email (MUST Email MSDH a copy)

Date Emailed: ____ / ____ / ____

- As a URL (Provide URL _____)
 As an attachment
 As text within the body of the email message

CCR was published in local newspaper. *(Attach copy of published CCR or proof of publication)*

Name of Newspaper: **RANKIN COUNTY NEWS**Date Published: **6 / 1 / 2016**

CCR was posted in public places. *(Attach list of locations)*

Date Posted: ____ / ____ / ____

CCR was posted on a publicly accessible internet site at the following address (**DIRECT URL REQUIRED**):

CERTIFICATION

I hereby certify that the 2015 Consumer Confidence Report (CCR) has been distributed to the customers of this public water system in the form and manner identified above and that I used distribution methods allowed by the SDWA. I further certify that the information included in this CCR is true and correct and is consistent with the water quality monitoring data provided to the public water system officials by the Mississippi State Department of Health, Bureau of Public Water Supply.

 Name/Title (President, Mayor, Owner, etc.)

6/7/2016

Date

*Deliver or send via U.S. Postal Service:
 Bureau of Public Water Supply
 P.O. Box 1700
 Jackson, MS 39215*

*May be faxed to:
 (601)576-7800*

May be emailed to:

CCR Due to MSDH & Customers by July 1, 2016!

 Pearl, MS 39288-4195

City of Pearl 2015 Annual Drinking Water Quality Report PWS ID# 0610017

Is my water safe?

We are pleased to present this year's Annual Water Quality Report (Consumer Confidence Report) as required by the Safe Drinking Water Act (SDWA). This report is designed to provide details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. This report is a snapshot of last year's water quality. We are committed to providing you with information because informed customers are our best allies.

Do I need to take special precautions?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Water Drinking Hotline (800-426-4791).

Where does my water come from?

Our water comes from ten wells drawing from the Sparta Sand Aquifer. These wells can produce over 600,000 gallons of water per hour. Five of these wells have emergency powered generators that would allow the City of Pearl to produce over 300,000 gallons per hour in the case of emergency power outages. In 2015, the City of Pearl made plans to drill a new well to supply water to our 2 million gallon tank and our golf course tank both on Center City Drive. Also, twenty-four feet will be added to the height of the golf course tank, increasing the storage capacity from 500,000 gallons to 800,000 gallons. The golf course tank will add 800,000 gallons of stored water to the daily operation. In case of an emergency, the golf course tank can be used as a major supplier of water for the City of Pearl.

Source water assessment and its availability

Our source water assessment has been completed. Copies of this assessment are available upon request.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity:

microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; and radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

How can I get involved?

The City of Pearl holds its monthly board meetings on the first and third Tuesday of each month at 6:00 p.m. at City Hall. We encourage all customers who have any questions or concerns regarding their water service or other public services that the city provides to meet with us. We ask that customers who have questions concerning their bills, regarding disruptions in service, or other technical concerns to please first contact the City of Pearl Water Department at the telephone number listed below.

Description of Water Treatment Process

Your water is treated by disinfection. Disinfection involves the addition of chlorine or other disinfectant to kill dangerous bacteria and microorganisms that may be in the water. Disinfection is considered to be one of the major public health advances of the 20th century.

Cross Connection Control Survey

The purpose of this survey is to determine whether a cross-connection may exist at your home or business. A cross connection is an unprotected or improper connection to a public water distribution system that may cause contamination or pollution to enter the system. We are responsible for enforcing cross-connection control regulations and insuring that no contaminants can, under any flow conditions, enter the distribution system. If you have any of the devices listed below please contact us so that we can discuss the issue, and if needed, survey your connection and assist you in isolating it if that is necessary.

- Boiler/ Radiant heater (water heaters not included)
- Underground lawn sprinkler system
- Pool or hot tub (whirlpool tubs not included)
- Additional source(s) of water on the property
- Decorative pond
- Watering trough

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. PWS ID# 0610017 is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Additional Information for Fluoridation

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", MS0610017 is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.7-1.3 ppm was 12. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.7-1.3 ppm was 99%.

Water Quality Data Table

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The table below lists all of the drinking water contaminants that we detected during the calendar year of this report. Although many more contaminants were tested, only those substances listed below were found in your water. All sources of drinking water contain some naturally occurring contaminants. At low levels, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and have nutritional value at low levels. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. As such, some of our data, though representative, may be more than one year old. In this table you will find terms and abbreviations that might not be familiar to you. To help you better understand these terms, we have provided the definitions below the table.

Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Your Water	Range		Sample Date	Violation	Typical Source
				Low	High			
Disinfectants & Disinfectant By-Products								
(There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants)								
Haloacetic Acids (HAA5) (ppb)	NA	60	20	10	29	2014	No	By-product of drinking water chlorination
Chlorine (as Cl2) (ppm)	4	4	1.6	0.6	3.0	2015	No	Water additive used to control microbes
TTHMs [Total Trihalomethanes] (ppb)	NA	80	23.64	12	30	2014	No	By-product of drinking water disinfection
Inorganic Contaminants								
Barium (ppm)	2	2	0.0015	0.0015	0.0015	2014	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Fluoride (ppm)	4	4	1.23	1.21	1.23	2014	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Chromium (ppb)	100	100	10	9.7	10	2014	No	Discharge from steel and pulp mills; Erosion of natural deposits
Contaminants	MCLG	AL	Your Water	Sample Date	# Samples Exceeding AL	Exceeds AL	Typical Source	
Inorganic Contaminants								
Copper - action level at consumer taps (ppm)	1.3	1.3	.193	2013	0	No	Corrosion of household plumbing systems; Erosion of natural deposits	
Lead - action level at consumer taps (ppb)	0	15	1	2013	0	No	Corrosion of household plumbing systems; Erosion of natural deposits	

Unit Descriptions	
Term	Definition
ppm	ppm: parts per million, or milligrams per liter (mg/L)
ppb	ppb: parts per billion, or micrograms per liter (µg/L)
NA	NA: not applicable
ND	ND: Not detected
NR	NR: Monitoring not required, but recommended.

Important Drinking Water Definitions	
Term	Definition
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MCL	MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
TT	TT: Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
AL	AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Variance and Exemptions	Variance and Exemptions: State or EPA permission not to meet an MCL or a treatment technique under certain conditions.
MRDLG	MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MNR	MNR: Monitored Not Regulated
MPL	MPL: State Assigned Maximum Permissible Level

City of Pearl 2016 Annual Drinking Water Quality Report PWS ID# 0810017

Why are we here?
We are pleased to present to you the Annual Water Quality Report. Compliance with the Safe Drinking Water Act (SDWA) is the responsibility of the City of Pearl. We are committed to providing you with information to help you make informed decisions about your water.

Did you know?
Some people may be more vulnerable to contaminants in drinking water than the general population. Infants and young children, pregnant women, and the elderly are particularly at risk. Some people who take certain medications may also be at risk. If you are in one of these categories, you should consult with your health care provider about the potential risks to you from drinking water. For more information, contact the U.S. Environmental Protection Agency (EPA) at 1-800-426-4791.

Where does our water come from?
Our water comes from two sources: surface water from the Pearl River and groundwater from the Pearl River aquifer. These wells can produce over 200,000 gallons of water per day. Five of these wells have emergency generators that would produce 200,000 gallons per hour in the case of an emergency power outage. In 2014, the City of Pearl made plans to upgrade its water supply to use 2 million gallons per day of water from the City of Pearl. Also, twenty-four wells will be added to our supply of drinking water to increase the amount of water available to the City of Pearl.

Source water assessment and its results
Our source water assessment has been completed. Copies of this assessment are available upon request.

Why are there contaminants in my drinking water?
Drinking water, including bottled water, may occasionally be exposed to contaminants at levels above those permitted by the SDWA. The presence of these contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency (EPA) Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, streams, wells, and other surface water and groundwater sources. Contaminants that may be found in surface water include: pesticides, herbicides, fertilizers, and other chemicals; oil, grease, and other petroleum products; and other pollutants. Contaminants that may be found in groundwater include: pesticides, herbicides, fertilizers, and other chemicals; oil, grease, and other petroleum products; and other pollutants. Contaminants that may be found in bottled water include: lead, copper, and other metals; and other contaminants. Contaminants that may be found in tap water include: lead, copper, and other metals; and other contaminants. Contaminants that may be found in bottled water include: lead, copper, and other metals; and other contaminants.

How can I get involved?
The City of Pearl holds a monthly board meeting on the first and third Tuesday of each month at 6:00 p.m. at City Hall. We encourage all customers who have any questions or concerns regarding the water supply or other public services that the city provides to meet with us. We ask that customers who have questions concerning their bills, regarding disconnections to service, or other technical concerns to please first contact the City of Pearl Water Department at the address number listed below.

Description of Water Treatment Process
Your water is treated by disinfection. Disinfection involves the addition of chlorine or other disinfectant to kill disease-causing bacteria and other organisms that may be in the water. The disinfection is considered to be one of the most important public health services of the 20th century.

Cross Connection Control Survey
The purpose of this survey is to determine whether a cross-connection may exist at your home or business. A cross-connection is an unapproved or improper connection to a public water distribution system that may cause contamination or pollution to enter the system. We are responsible for providing high quality drinking water, but cannot be held liable for the quality of materials used in plumbing components. When your water has been used for a short time, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water testing methods and other water use can be found on the EPA website at www.epa.gov/lead.

- Backflow preventer (water meters not included)
- Underground lawn sprinkler system
- Pool or hot tub (underground tubes not included)
- Aditional shower(s) or water on the property
- Dispersive pond
- Watering trough

Additional Information for Lead
If present, elevated levels of lead can cause serious health problems, especially for infants, women and young children. Lead in drinking water is primarily from materials or pipes used in the home. It is important to know that lead enters your water from your home's plumbing system, not from the water supply. To reduce lead in the water from your home's plumbing system, you can: flush your tap water for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water testing methods and other water use can be found on the EPA website at www.epa.gov/lead.

Additional Information for Fluoridation
To comply with the "Safe Drinking Water Act," the City of Pearl is required to report certain results pertaining to the fluoridation of our water system. The number of months in the previous calendar year in which average fluoride levels were within the optimal range of 0.7-1.3 ppm was 12. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.7-1.3 ppm was 99%.

Water Quality Data Table

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The table below lists all of the drinking water contaminants that we detected during the calendar year of this report. Although many more contaminants were tested, only those substances listed below were found in your water. All sources of drinking water contain some naturally occurring contaminants. As a result, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and have nutritional value at low levels. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA's maximum contaminant level goal (MCLG) is the level of a contaminant in drinking water that the EPA considers to be safe. The EPA's maximum contaminant level (MCL) is the level of a contaminant in drinking water that the EPA considers to be safe. The EPA's maximum contaminant level (MCL) is the level of a contaminant in drinking water that the EPA considers to be safe. The EPA's maximum contaminant level (MCL) is the level of a contaminant in drinking water that the EPA considers to be safe.

Contaminant	MCLG	MCL	Year	Range	Source	Violation	Typical Source		
	at or below	at or below		Low	High				
Chlorine Residual (ppm)									
Chlorine (as Cl ₂) (ppm)	4	4	1.0	0.5	3.0	2015	No	Byproduct of drinking water disinfection	
Disinfection Byproducts (ppm)									
Trihalomethanes (THMs) (ppm)	NA	NA	20	23.84	12	20	2014	No	Byproduct of drinking water disinfection
Other Drinking Water Contaminants									
Boron (ppm)	2	2	0.0015	0.0015	0.0015	2014	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits	
Fluoride (ppm)	4	4	1.23	1.21	1.23	2014	No	Erosion of natural deposits; Discharge from switch gear manufacturing facilities; Discharge from fertilizer and aluminum facilities	
Chromium (ppm)	100	100	10	9.1	10	2014	No	Discharge from steel and pulp mills; Erosion of natural deposits	
Contaminants with MCLs									
Copper - action level at consumer taps (ppm)	1.3	1.3	192	2013	0	No	Corrosion of household plumbing fixtures; Erosion of natural deposits		
Lead - action level at consumer taps (ppm)	0	15	1	2013	0	No	Corrosion of household plumbing fixtures; Erosion of natural deposits		
Unit Descriptions									
ppm	Definition								
ppb	Parts per billion, or 1/1000th of a part per million (ppm)								
NA	Not applicable								
ND	Not detected								
NR	Not required or not reported								
Regulatory Drinking Water Contaminants									
Definition									
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.								
MCL	MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set to protect the MCLG. Or as feasible using the best available treatment technology.								
TT	TT: Treatment Technique: A required process or technology to reduce the level of a contaminant in drinking water.								
AD	AD: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.								
Variances and Exemptions	Variances and Exemptions: State or EPA publishes rules or permits by MCL, or a treatment technique under certain conditions.								
MROD	MROD: Maximum residual disinfectant level goal. This is the maximum allowable residual disinfectant concentration in drinking water. MROD is set to protect the public health from the use of disinfectant byproduct.								
MROD	MROD: Maximum residual disinfectant level. This is the maximum allowable residual disinfectant concentration in drinking water. MROD is set to protect the public health from the use of disinfectant byproduct.								
MNL	MNL: Maximum Nitrate Level								
MPL	MPL: State Approved Maximum Permissible Level
