2020 Annual Drinking Water Quality Report Moore Bayou Water Association, Inc. PWS#: 0140012, 0140051 & 0140052 May 2021

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Meridian Upper Wilcox Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Moore Bayou Water Association have received a lower susceptibility ranking to contamination.

If you have any questions about this report or concerning your water utility, please contact Thomas E. Clayton, Jr. 662.326.3322. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meeting. They are held on the third Tuesday of each month at 6:00 PM at the Thomas Clayton Office in Marks, MS.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2020. In cases where monitoring wasn't required in 2020, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Chlorine	N	2020	.7	.58	ppm	0	MRDL =	Water additive used to control microbes

^{*} Most recent sample. No sample required for 2020.

Disinfection By-Products:

We routinely monitor for the presence of drinking water contaminants. The water supplied from system #0140052 presented high levels of TTHM in all quarters of 2020. The system has added more chlorine and continue to flush the lines regularly and plan to connect to the original system.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Moore Bayou Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

⁽⁸²⁾ Total Trihalomethanes (TTHMs). Some people who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.

Towner declined to comment about Stringer's employment and the next step to find a new coach.

In the video Thursday, Stringer thanked God for opportunity to be at CCC for six years. He played basketball for CCC, graduated from Coahoma County High School in 1994, was the Oakhurst Middle School principal and coached in several capacities in the Clarksdale Municipal School District and then-Coahoma Agricultural High School. He talked about how he worked in community for

20 years total.

"At this point, I think it's time for me to change chapters," Stringer said. "I think it's time for me to move forward. At this time, someone has made a recommendation saying they want me to resign from my job duties at Coahoma Community College and I just want to say thank God for all the opportunity. Normally, in the past, I'd probably be all upset and disgruntled and things like that. But I started looking at it where God is taking me. Sometimes in life you've just got to move on. Sometimes you just go where God wants you to go.'

Stringer said he has put everything in God's hands.

"Like a young black man like me, I came from the project to the Pinnacle," said Stringer, who grew up in a one-

parent home.

Stringer said he is thankful and blessed to be position in, thanked everyone for their support and blessed those who did not support him. Speaking to the administration, he said prayed and hope things improved. He praised the job CCC women's basketball coach Stephanie Murphy, women's assistant basketball coach Isaiah Butler and head football coach Travis Macon have done to improve the athletic pro-

Stringer said the men's basketball program did not win a game the year before he took over and he is leaving the pro-

gram better than he found it.

"All the kids that have graduated, all the kids that are former players that have worked hard for me, I'm just really blessed and thankful that God entrusted me and their parents entrusted me to help lead and guide them for the years that I have guided them," Stringer said.

Stringer said the last three years the CCC men's basketball team had a 93 percent graduation rate along with the highest GPA on campus at one point at 2.9. He added God placed something inside him to encourage and motivate kids to do better.

2000 Annual Drinking Water Quality Report Moore Bayou Water Association, Inc. PWS#, 0140012, 0140051 & 0140052 May 2021

Wa've pleased to present to you this year's Annual Quality Water Report. This seport is dampined to inform you should be qualify water and services we deliver to you every day. Our constant good is to possible you with a talk and departable supply of straking valer. We want you to understand the effect we make to continually improve the water treatment process and profect our water securities. We are constitled to ensuring the quality of your water. Our water source is from wells disasting from the Manuface Uldere Algular.

The source water measurement has been completed for our public water system to determine the owner succepts by a to driving water apply to identified potential sources of contamination. A report containing detailed information on how the stangesticity determinations were expely has been furthered to our public water system and is available for victority upon request. The wate for the their Sayou Water Ausporation have recovered a lower succeptibility ranking to contamination.

If you have any questions receif this recent or concerning your water utility, pieces contact Thomas E. Chapter, is, this 2953222. We want our valued contrasted to be informed about their water utility. If you want to come size, please attend any of our regularly achieved meeting. They are held on the third Tuesday of each meetin at 5:00 PM of the Thomas Clayton Office in Marks, MS.

We continuely receive for continuence in your driving water eccording to Federal and State large. This state below hats all all the driving water continuence that we detected during the period of distrainty of to December 31th, 2020, in colors where maintening water country the latter related the most received makes of each continuence of an energepeated, it escall we trained or from turner and a pick on substances or commitmed from the presence of animals or from turner activity, misrobial conferencements, such as whome and bacteria, that may come from sowage training occurring or result from about alarm value contentions, and whether interprets contentionals, such as tasts and metals, which can be naturally occurring or result from about alarm value contention, or dominate as a september, which are detected, which and gos production, mining, or ferming personal detectable, which may come result interprets occurring to exceed the mining from a variety of sources such as agriculture, when are strainwater munit, and residential uses, suggest detectable, which are storing water than the production, and contain any applications, in which are such as a spin applications, which can be naturally occurring or be the result of oil and gas production and mining attacked in contain containing in extensions. In order to ensure that tap water is sate to durin. EPA prescribes regulations that the amount of cuttain containing in extension is contained by paticle under a spin application. It is important to interpretation of those contaminants does not necessarily indicate that the sensing process a buildhood of some contaminants. The important is interested to the period of those contaminants does not necessarily indicate that the sensing process a buildhood.

to this labely you will find energy before and addresistance you might not be familiar with. To help you befor undersized those terms we've provided the following definitions:

Addice Level - the concentration of a contactment which, if exceeded, higgers bushness or other recomments which a value explain much follow.

Aftermum Conformation (ArCE) - The "blockmum Allowed" (ArCE) is the highest level of a contominant that is allowed in drinking water.

MCLs are set as close in the MCLSo as feasible using the best available treatment technology.

Maximum Contaminant Lover Cont (MCLG) - The "Gont (MCLG) is the level of a contaminant in dimining water below which there is no known or expected risk to health. MCLGs above for a margin of salety.

Maximum Residual Orantestant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is conditing evidence that addition of a disinfectant is secressary to control relocated contaminants.

Maximum Resistant Disinfectors Cover Good (MRSECS) — The level of a disinling water disinfectors below which there is no increase or dependently of health. MRSECS do not reflect the benefits of the user of disinfectors to coronal extendition contaminants.

Posts per million (port) or Milligranis per liter (mg/l) - one part per million corresponds to one minute in two years or a single sensy in \$15,000.

Plants per billion (4015) or Micrograms per filter - one part per billion corresponds to one minute in 2,000 years, or a single persy in \$10,000,000.
