# 2023 Annual Drinking Water Quality Report Town of Chunky Water Department PWS#: 0510002 May 2024

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

#### Contact & Meeting Information

If you have any questions about this report or concerning your water utility, please contact Joyce Reynolc's at 601.655.8376. We want our valued customers to be informed about their water utility. If you want to learn more, please join us at a y of our regularly scheduled meetings. They are held on the first Tuesday after the first Monday of the month at 6:00 PM at the Town Hall Meeting Room.

#### Source of Water

Our water source is from a well drawing from the Wynonna Tallhatta Aquifer. The source water assessmen has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been fi rnished to our public water system and is available for viewing upon request. The well for the Town of Chucky Water Department has received a lower ranking in terms of susceptibility to contamination.

## Period Covered by Report

We routinely monitor for contaminants in your drinking water according to federal and state laws. This report is based on results of our monitoring period of January 1st to December 31st, 2023. In cases where monitoring wasn't required in 2023, the table reflects the most recent testing done in accordance with the laws, rules, and regulations.

As water travels over the surface of land or underground, it dissolves naturally occurring minerals and in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or let the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regula ions that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

#### Terms and Abbreviations

In the table you may find unfamiliar terms and abbreviations you might not be familiar with. To help you be tter understand these terms we've provided the following definitions:

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

<u>Maximum Contaminant Level (MCL)</u>: The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

<u>Maximum Contaminant Level Goal (MCLG)</u>: The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

<u>Maximum Residual Disinfectant Level (MRDL)</u>: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

<u>Maximum Residual Disinfectant Level Goal (MRDLG)</u>: The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per billion (ppb) or micrograms per liter: one part by weight of analyte to 1 billion parts by weight of the water sample.

Parts per million (ppm) or Milligrams per liter (mg/l): one part by weight of analyte to 1 million parts by weight of the water sample.

				TEST F	RESULT	ΓS				
Contaminant	Violation Y/N	Date Collected	Level Detected	Range of Detects or # of Samples Exceeding MCL/ACL/MRDL	Unit Measure- ment	MCLG	MCL	Likely Sc	ource of Contain	ination
Inorgani	c Conta	aminan	ts							
10. Barium	N	2019*	.0165	No Range	ppm	2	2	discha g	e of drilling was e from metal ret of natural depos	neries;
13. Chromium	N	2019*	5.2	No Range	ppb	100	100		e from steel and of natural depos	
14. Copper	N	2021/23	.3	0	ppm	1.3	AL=1.3	system s	n of household erosion of natu from wood pres	ral deposits;
17. Lead	N	2021/23	1	0	ppb	0	AL=15		n of household erosion of natu	
Unregula	ated Co	ntamir	ants							
Sodium	N	2022*	33.8	No Range	ppm	20	0	Chemi a	lt, Water Treatn ls, Water Softer Effluents.	
Disinfect	ion By	-Produ	cts							
Chlorine	N	2023	1	.78 – 1.49	ppm	0	MRDL = 4	Water in	Iditive used to c	ontrol

<sup>\*</sup> Most recent sample. No sample required for 2023.

Inorganic Contaminants:

Symptoms include shortness of breath and blue-baby syndrome.

Unregulated Contaminants:

Sodium. EPA recommends that drinking water sodium not exceed 20 milligrams per liter (mg/L). Excess sodium from salt in the die increases the risk of high blood pressure and cardiovascular disease.

We are required to monitor your drinking water for specific contaminants on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance periol.

### LEAD INFORMATION

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plu nbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in r umbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you r lay wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

Our system received a major monitoring violation, during January 1, 2023 - December 31, 2023 we didn' complete monitor or test for Nitrates/Nitrites and therefore cannot be sure of the quality of our drinking water during that time.

## UNREGULATED CONTAMINANTS

unregulated Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose contaminant monitoring is to assist EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulations are warranted.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man-made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Im nuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplar s, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotlin€ 1.800.426.47

The Town of Chunky Water Department works around the clock to provide top quality water to every tap. We ask that all bur customers help us protect our water sources, which are the heart of our community, our way of life and our children's luture.

<sup>(20)</sup> Nitrate. Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated Symptoms include shortness of breath and blue-baby syndrome.

<sup>(21)</sup> Nitrite. Infants below the age of six months who drink water containing nitrite in excess of the MCL could become seriously ill nd, if untreated, may die.
